Salesmsg + HubSpot integration

Salesmsg and HubSpot, end to end

What the integration does, how your data moves, and where the limits are.

3 parts, 1 marketplace install

Contact sync, surfaces and workflow actions

The three pieces

Each part works with the others, but they behave differently and they're configured in different places.

Piece 1

Contact sync

- Two-way record updates
- Ownership and notes
- HubSpot list imports

Piece 2

Surfaces

- App Card and widget
- HubSpot channel
- Salesmsg sidebar data

Piece 3

Automation

- Send SMS via workflows
- Create and update contacts
- Enroll into AI agents

Settings survive a reconnect

If you disconnect and reconnect the integration, your mappings, workflows and reports stay exactly as they were.

Salesmsg + HubSpot integration

Messaging and calling

Send texts and place calls from inside HubSpot without switching apps.

Messaging and calling capabilities

Send SMS & MMS	Send messages from HubSpot. Smart Inbox lets you override the Smart Sender.
Calling	Place calls through the Salesmsg calling widget in HubSpot.
Default calling inbox	Each user saves a preferred inbox, pre-selected every time the widget opens.
Call outcomes	Outcomes save to HubSpot however the call ends, including voicemail and abrupt close.
Call transcription	Transcript pushes to the native HubSpot call log. Breeze AI summarizes it.
AI Booking Agent	Connects to HubSpot Meetings. Finds availability, books, reschedules or cancels via text.

Logged call outcomes

Outbound: Connected, No answer, Busy. Inbound: Missed, Left Live Voicemail. All outcomes save automatically to HubSpot.

Salesmsg + HubSpot integration

Contacts, data and surfaces

How contact records stay in sync and where each product appears.

Contact and data sync

Two-way contact sync	Updates flow both directions with real-time search by name, phone number or email.
Conflict resolution	Duplicates are resolved in real time by a user or offline, never guessed.
Custom property sync	Maps Salesmsg properties to HubSpot contacts. Runs from Salesmsg to HubSpot only.
Note sync	Conversation notes sync as native HubSpot notes carrying the Salesmsg user tag.
Timeline activities	Calls, messages, notes and voicemails each log as their own HubSpot timeline event.

Where each product shows up

App Card	Native card on Contacts, Deals, Companies, Tickets, Orders, Leads and Carts.
HubSpot channel	Salesmsg inbox appears inside HubSpot Inbox and Help Desk via Custom Channel API.
HubSpot data sidebar	A card in Salesmsg shows the linked contact, deal, company and ticket properties.
Salesmsg widget	Full conversation history, MMS and back-and-forth threads inside HubSpot.

Plan contact import before launch

Connecting the integration doesn't pull existing HubSpot contacts. They arrive through workflows, the Salesmsg extension, live search or a CSV import.

Salesmsg + HubSpot integration

Workflows and automation

Triggers and actions that send messages, create contacts and enroll people.

Workflow capabilities

Available across Contact, Company, Deal, Ticket, Quote, Feedback and Custom Object workflows.

Send SMS action	Three send-from choices: a specific inbox, the contact owner, or Advanced mapping.
Create & update contacts	Create or update a Salesmsg contact from a contact-based workflow.
Enroll into automations	Enroll contacts into AI agents from a workflow using the contact owner's inbox.
Round-robin	Applies to outbound messages too, so mass sends don't pile up unassigned.
Workflow statistics	Webhook-receipt status shows whether Salesmsg created and delivered each message.

When a workflow send doesn't arrive

Some conditions stop a message silently. The action log shows success but nothing sends.

No credits left	Logged as success, message not sent.
Contact opted out	Logged as success, message not sent.
Invalid number	Logged as success, message not sent.
HubSpot disconnected	Error returned in the workflow action log.

Messages from HubSpot cost credits

Rep or workflow, it draws from the same balance. Model usage before you automate at volume.

Salesmsg + HubSpot integration

Limits and common questions

Design around these constraints and get answers to what teams ask most.

Limits worth knowing

One org, one account	One Salesmsg organization connects to one HubSpot account. Two accounts means two orgs.
Property sync one-way	Custom properties sync Salesmsg to HubSpot only. Plan your data model accordingly.
App Card: SMS only	No MMS, threads or conversation history. Use the full widget for those features.
Broadcast exclusion	"This list AND tag is not X" isn't available yet. Open feature request.
Outbound call logging	Can't log outbound calls as Left Live Voicemail. Inbound only.
Carrier rules apply	Sending from HubSpot still uses your Salesmsg number. Registration and opt-in rules apply.

What teams ask us most

Can HubSpot be our source of truth for contacts?

For contact records, yes. Sync runs both ways. Custom properties are the exception: they flow from Salesmsg to HubSpot only.

Can two HubSpot users share one Salesmsg user?

Yes. Most teams have more HubSpot users than Salesmsg seats. Contacts behave as if owned by the mapped user.

Do we need engineers to set this up?

No. Your Salesmsg team connects the integration during onboarding. The App Card is the one piece each user adds themselves.

Will disconnecting lose our configuration?

No. Mappings, workflows and reports are all preserved when you reconnect.
